- Quick recap

1. Introduction

This documentation outlines the workflows, interface navigation, and operational procedures for the **Finance Operations Dashboard**. The platform utilizes Ora AI to automate the end-to-end lifecycle of financial transactions, including statement reception, reconciliation, query management, and final ledger posting.

The system is designed to distinguish between standard straight-through processing (STP) and complex exception handling, optimizing the finance operator's time by focusing human intervention only where necessary.

2. Dashboard Overview

Upon logging in, the **Finance Operations Dashboard** provides a real-time, high-level view of the organization's financial health and processing efficiency.

2.1 Key Performance Indicators (KPIs)

The top ribbon displays the live status of all transaction volumes:

- **Total Transactions:** The aggregate number of transactions currently in the pipeline.
- **Receive Statement:** Transactions in the intake phase (parsing/extraction).
- **Reconciliation:** Transactions currently undergoing three-way matching.
- **Query Management:** Transactions stalled due to blockers requiring internal or external resolution.

- **Completed:** Transactions successfully posted to the ledger.

2.2 Portfolio View (The Funnel)

The central widget is a visual funnel representing the flow of transactions.

- **Function:** It illustrates the attrition of transactions as they move from *Total* down to *Completed*.
- **Blocker Visibility:** Red badges (e.g., "6 Blockers") indicate exactly how many items are stuck at specific stages, allowing operators to prioritize bottlenecks immediately.

Portfolio View

2.3 Ora AI Performance & Operational Efficiency

Located on the left panel, these widgets track system and team performance:

- **Active Blockers:** A prioritized list of specific transactions (e.g., BR-000068PRM) facing critical issues like "Tax Variance" or "Doc Issues."

- **Efficiency Metrics:**

- **Avg. Processing Time:** (e.g., 2.3h) Tracks speed of resolution.
- **STP Rate:** Percentage of transactions processed without human touch.
- **Efficiency Gain:** Month-over-month performance improvement.

2.4 Blocker Queue & AI Confidence

Located on the right panel, this section breaks down the AI's effectiveness:

- **Auto-Reconciliation Distribution:** Visualizes the split between transactions auto-reconciled by AI versus those requiring manual review.
- **Blocker Selection Efficiency:** A graph categorizing blockers by type (Tax Variance, Payment Due) and the AI's success rate in identifying them.

- **AI Recommended Actions:** A dynamic list of "next best actions" suggested by Ora AI to clear the queue (e.g., "Follow up on [Reference ID]").

2.5 Filtering and Views

To manage large volumes of data, the dashboard offers granular filtering capabilities:

- **Transaction Type:** Filter by Premium Payments, Claims Payments, Commission, Refunds, or Adjustments.
- **Status:** Pending, Allocated, Reconciled, Exception, Suspended.
- **Amount Range:** Filter by specific monetary thresholds (e.g., Under \$1,000).
- **Date Range:** Select specific operational periods (Today, Last Month, Last Quarter).

3. Transaction Management Screen

Operators access this screen by clicking **"View Transactions"** from the dashboard. This screen is the primary workspace for processing financial records.

3.1 Filtering and Views

To manage large volumes of data, the dashboard offers granular filtering capabilities:

- **Transaction Type:** Filter by Premium Payments, Claims Payments, Commission, Refunds, or Adjustments.
- **Status:** Pending, Allocated, Reconciled, Exception, Suspended.
- **Amount Range:** Filter by specific monetary thresholds (e.g., Under \$1,000).
- **Date Range:** Select specific operational periods (Today, Last Month, Last Quarter).

3.2 Classification: Complex vs. Non-Complex

The system automatically segments transactions to streamline workflows. This segmentation is visible as expandable sections within the UI.

Transaction Type	Definition & Criteria	Workflow
Non-Complex Transactions  Non-Complex Transactions 42 transactions	Transactions with an AI Confidence Score > 90% . These are standard entries with clear matching data (Broker, Bank, Ledger) and no anomalies.	Straight-Through Processing (STP). These move rapidly through stages with zero to minimal manual intervention.
Complex Transactions  Complex Transactions 11 transactions	Transactions with an AI Confidence Score < 90% . These involve discrepancies, missing documentation, or variances exceeding thresholds.	Manual Intervention Required. These are flagged for operator review and often require "Query Management."

Non-Complex transactions:

Non-Complex transactions are those where Ora AI has a high level of confidence (AI Confidence Score ≥ 90) and where broker, bank, and ledger data align cleanly.

These items show clear matches with no missing information or material variances, making them ideal candidates for straight-through processing.

In the interface, Non-Complex items are routed through a streamlined workflow designed to complete with zero or minimal human intervention, freeing Finance Operator to focus on more challenging cases.

Blocker – Gross Premium Variance Within Threshold (Non-Complex Transaction) (BR-000045PRM)

Scenario overview

- A premium collection transaction (for example, BR-000045PRM) enters the system as a Non-Complex item with Priority: High and an amount of around €30,471.10.
- Ora AI detects a small variance between the broker remittance and the bank statement (for example, –€20.00) but classifies it as within the configured variance threshold.
- Because the variance is low-severity and auto-resolution eligible, the transaction is handled end-to-end by Ora AI with no manual intervention required from the Finance Operator.

Identifying the Gross Variance blocker on the dashboard card

- On the Finance Operations Dashboard, the card for the transaction shows a “Blocker Detected” chip at the top, indicating that a variance was found during reconciliation.
- The main amount displays the reconciled value along with a line showing the variance amount in red, making the difference from the expected amount immediately visible.
- Within the card, the Ora AI Processing panel shows the Reconciliation progress (for example, 89%) and a status line such as “Identifying installments and prior balances”, confirming that the system is actively processing the entry.
- A yellow pill labelled “Gross Variance – Within Threshold” appears above the assignee, indicating that the variance is inside the approved tolerance and eligible for automatic resolution, even though a blocker was technically detected.

Receive Statement – intake and initial classification

- In Step 1 of the 5-Stage Workflow, Ora AI ingests the broker remittance statement for the transaction, reading the declared amount, policy number, and other key fields.
- The system records the source (for example, a broker statement file) and marks the status as “Incoming”, which is visible in the Step 1 timeline row.
- At this point, the transaction is already tagged as Non-Complex because all core references and structure look standard, and there are no obvious data gaps.

Auto-Reconciliation – variance detection

- In Step 2, Auto-Reconciliation, Ora AI matches the broker remittance against the corresponding bank transaction.
- The workflow row shows both the received amount and the expected amount, along with a high match confidence on the underlying mapping.
- The system detects a gross premium variance (for example, €20.00) between the two amounts and marks Auto-Reconciliation as complete, passing the transaction forward for variance handling.

Blocker stage – Gross Premium Variance within threshold

- In Step 3, the workflow labels the stage as “Blocker: Gross Premium Variance”, but the details clarify that the variance is within the acceptable threshold (for example, €20.00 variance vs. a €30.00 threshold).
- The stage description notes the variance amount, the configured variance threshold, the low blocker severity (green), and the fact that the case is “Auto-resolution: Eligible”.
- Because the variance is inside tolerance, the transaction remains classified as Non-Complex, and no manual task is assigned to the Finance Operator, even though the card still reflects

that a blocker was detected.

Query Management – internal auto-resolution

- In Step 4, Query Management, Ora AI opens an internal query to resolve the variance automatically; this is an internal, system-driven step that does not require operator input.
- The workflow row indicates “Query Type: Internal – Auto-resolved” with a resolution such as “Written off as bank charges”, and clearly states that the variance is within the configured threshold.
- Auto-approval is marked as “Approved automatically”, and the step notes that no manual intervention is required, confirming that from the Finance Operator’s perspective the transaction simply progresses on its own.

Completed – posting and audit trail

- In Step 5, Completed, the transaction is reconciled and posted to the ledger with a final status such as “Written-off”.
- The workflow line records the ledger entry ID, confirms reconciliation is 100% complete, and notes that the total variance has been written off as bank charges.
- The audit trail captures each of the five steps—Statement Received, Auto-Reconciliation, Gross Premium Variance, Query Management (auto-resolved), and Completed—creating a clear, end-to-end record of how this Non-Complex variance blocker was automatically handled.

Summary – operator view of this blocker flow

- A small gross premium variance (for example, around 20 units of currency) is detected during reconciliation on a Non-Complex transaction but remains within the configured threshold.
 - The system marks a “Blocker Detected” and labels it as “Gross Variance – Within Threshold”, yet fully auto-resolves it through an internal Query Management step by writing off the amount as bank charges.
 - From the Finance Operator’s perspective, the transaction progresses automatically from Receive Statement through Reconciliation and internal variance resolution to Completed, while the full 5-stage journey and rationale remain visible in the transaction detail view for audit and review.
-

Blocker – Duplicate or invalid payment – transaction rejected(BR-000089PRM)

Scenario overview

- A premium collection transaction (BR-000089PRM) for £8,750.00 enters the system and appears on the dashboard as Closed, Non-Complex – Priority: High.
- Ora AI compares this payment with prior records and detects that an identical payment for the same policy has already been received, allocated, and completed.
- The transaction is automatically classified as a duplicate or invalid payment, is rejected by the system, and will be returned or reversed rather than posted again to the ledger.

Identifying the rejected blocker on the dashboard card

- On the Finance Operations Dashboard, the card for BR-000089PRM shows the status “Closed” with Ora AI Processing at 100% and the message “Transaction completed.”
- Beneath the amount and processing bar, a yellow pill clearly states “Duplicate or invalid payment – transaction rejected,” signalling that this blocker has resulted in a hard rejection rather than a write-off or tolerance-based resolution.
- The card also displays key context such as premium type, timestamp, payer (Marsh & McLennan), policy number (10578FS24), and the assignee (Mike Ross), so the operator can immediately understand which relationship is affected.

Receive Statement – intake and initial classification

- In Step 1 of the 5-Stage Workflow, Ora AI ingests the broker remittance statement for BR-000089PRM, capturing the declared amount of £8,750.00, the policy 10578FS24, and the remittance reference from the uploaded statement image.
- The row notes that the broker remittance statement has been “received and ingested,” with status set to Incoming, confirming that the payment has entered the pipeline correctly.
- At this point, nothing appears structurally wrong with the payment; the potential issue only becomes visible once the system compares it with already-allocated items.

Auto-Reconciliation – duplicate risk detected

- In Step 2, Auto-Reconciliation, Ora AI matches the remittance against the bank transaction for £8,750.00, finding that the received and expected amounts are the same.
- However, the confidence score is very low (for example, 15%), indicating that while the fields technically line up, something about this transaction conflicts with past allocations.
- Auto-Reconciliation therefore completes with a low-confidence flag, and the transaction is passed into the blocker stage for deeper duplicate analysis instead of being treated as a normal match.

Blocker stage – Duplicate or invalid payment identified

- In Step 3, the system raises the blocker “Duplicate or invalid payment – transaction rejected” and marks it as active for BR-000089PRM.
- The Blocker Resolution Workflow shows a Payment Comparison table that lines up the Original Payment (allocated) against the Duplicate Payment (rejected) across fields such as Transaction Reference, Policy Number, Amount, Payer, and Received Date.
- In this example, both payments are for policy 10578FS24, both are for £8,750.00, and both list Marsh & McLennan as the payer; the only difference is that the original was received on an earlier date and has already been “Allocated and Completed.”

- The duplicate entry for BR-000089PRM is therefore given the status “Rejected – Duplicate Transaction,” clearly differentiating it from the original allocated payment.

Ora AI analysis and recommended actions

- The Ora AI Analysis panel explains that the payment matches all key identifiers (policy number, amount, payer, and reference) of a transaction that has already been received, allocated, and completed.
- Based on this analysis, Ora AI automatically rejects the duplicate transaction and notes that the payment will be returned to the broker or treated as an invalid transaction, preventing double allocation.
- Recommended Actions are presented as guided buttons, for example “Alert Broker” and “Refer to Finance Manager,” allowing the Finance Operator or Finance Manager to choose how to communicate and escalate the rejection.
- An Ora AI Recommendation is available to generate a detailed email to the broker, requesting corrected remittance documents or clarifying whether the payment was sent in error, ensuring the rejection is fully documented and auditable.

Exceptions & Blockers (1)

High Duplicate or invalid payment - transaction rejected

Payment of £8,750.00 for policy 10578FS24 has already been received and allocated. This appears to be a duplicate payment or invalid transaction.

Suggested Action

Transaction rejected - payment returned to broker

Ora AI Analysis

Duplicate payment detected. Original payment for policy 10578FS24 was received on 2024-09-01 and has been fully allocated. This transaction is invalid.

Resolution (Sep 5, 2024, 04:45 PM by Mike Ross)

Transaction rejected as duplicate payment. Finance Manager confirmed original payment already processed. Payment of £8,750.00 returned to Marsh & McLennan.

Completed – rejected outcome and audit trail

- Once the duplicate decision is confirmed, the 5-Stage Workflow shows Step 5 as Completed, but with an outcome aligned to rejection rather than successful allocation.
- The Completed step notes that reconciliation is finalized for this transaction and that its status is “Rejected – Duplicate Transaction,” ensuring it will not be posted again to the ledger as income.
- In the lower panels, Transaction Details continue to show the full payer, payee, policy, channel (such as Bank Transfer), bank reference, and statement source, so any reviewer can see exactly which payment was rejected.
- The Complete Audit Trail records events such as “Transaction received,” “Duplicate payment detected,” and “Transaction rejected – duplicate,” each with timestamps and the actor (Ora AI system or named user), giving a complete, chronological story of how this blocker was identified and resolved.

Complex transactions: how to recognize and handle

- Complex transactions are those where the AI Confidence Score falls below 90% or where the system detects discrepancies, incomplete or missing information, or variances above configured thresholds that prevent safe straight-through processing.
- These transactions are automatically surfaced for operator review and typically move into Query Management so that required internal approvals or external clarifications can be obtained.
- For Complex items, the Finance Operator should open the transaction, review key fields (amounts, dates, counter parties, policy or reference IDs), and check the current step in the 5-stage lifecycle.
- The operator should also review supporting documents and any AI-provided context to understand why the item has been classified as Complex before taking action.
- Based on this review, the Finance Operator chooses the appropriate next step—such as sending a clarification email, triggering an internal approval, or adjusting allocations—using Query Management and email workflows to maintain a clear, auditable trail.

Blocker – Gross Premium Variance Above Threshold (Complex – Manual Intervention) (BR-000052PRM)

Scenario overview

- A premium collection transaction (BR-000052PRM) for €30,421.10 enters the system with an expected amount of €30,491.10, creating a variance of –€70.00.
- Ora AI flags this as a **Gross Premium Variance** blocker because the variance exceeds the acceptable threshold of €30.00, and classifies the transaction as Complex – Priority: Critical.
- In this scenario, the Finance Operator's scope of action is limited to contacting the broker, requesting an adjustment so that the broker remits the missing €70.00.

Detecting the complex blocker on the transaction card

- On the Finance Operations Dashboard, the BR-000052PRM card shows the current variance (–€70.00) alongside the transaction amount of €30,421.10, making the shortfall immediately visible.
- The card indicates that Ora AI Processing is in Reconciliation, with ledger records already identified and a Gross Premium Variance warning chip displayed.
- The card shows key context such as Premium Collection, timestamp, payer (McGill and Partners Ltd), policy (12401EU24), and the assignee (Mike Ross), so the operator knows exactly which relationship and policy are affected.

Opening the Blocker Resolution Workflow

- When the operator clicks the Gross Premium Variance blocker on the card, the **Blocker Resolution Workflow** opens with a dedicated panel for this transaction.

- At the top, the Transaction Information section summarizes Reference (BR-000052PRM), Amount (€30,421.10), Expected (€30,491.10), Confidence Score (around 91%), From/To parties, and Assigned To: Mike Ross.
- A metrics table shows the variance (–€70.00) and the Acceptable Variance Threshold (€30.00), confirming that this shortfall is beyond tolerance and cannot be auto-resolved.

Reviewing Ora AI variance analysis

- The Ora AI Variance Analysis explains that both carrier and broker applied the same 5% brokerage rate but started from different gross premium amounts, which caused the €70.00 net shortfall.
- A Gross Premium Difference table compares carrier and broker calculations, showing carrier gross premium (€32,100.00), carrier net premium after brokerage (€30,495.00), broker gross premium (€32,026.32), and broker net premium (€30,425.00).
- The panel highlights the **Net Premium Difference** of €70.00 and clearly states that an adjustment is required at the broker end to align with the carrier's expected net premium.

The broker needs to remit an additional €70.00 to match the carrier's expected amount of €30,495.00.

Gross Premium Difference

Carrier gross premium:	€32,100.00
Carrier net premium (after 5% brokerage):	€30,495.00
Broker gross premium:	€32,026.32
Broker net premium (after 5% brokerage):	€30,425.00
Net Premium Difference:	€70.00

€30,495.00 - €30,425.00 = €70.00

The variance occurred because carrier and broker records show different gross premium amounts. Both correctly applied 5% brokerage, but starting from different base amounts.

Detailed Calculations

Reason
Discrepancy in gross premium amounts between carrier and broker systems. Both applied the same 5% brokerage rate, but calculated from different base premiums, resulting in the €70 variance.

Recommended Actions

Alerting the broker (manual intervention step)

- Under Recommended Actions, the operator sees guided buttons such as **Alert Broker**, **Refer to Finance Manager**.
- In this flow, the operator's scope is limited to contacting the broker, so they click **Alert Broker** to open the broker adjustment request email template.

Recommended Actions

[Alert Broker](#)[Refer to Finance Manager](#)

- The **Request Broker Adjustment** screen appears with a prefilled subject line (for example, “Request for Adjustment – Reconciliation Variance – Transaction BR-000052PRM”) and a structured email body describing the transaction, variance, and required top-up of €70.00.
- Ora AI populates all key details once the user clicks on generate with Ora AI

[Generate with Ora AI](#)

—transaction reference, policy reference, insured, expected amount, amount received, shortfall, and the full premium breakdown—so the operator only needs to review and click **Send Email**.

Request for Adjustment - Reconciliation Variance - Transaction BR-000052PRM

Generate with Ora AI

Email Body *

Dear Broker,

We have completed the reconciliation for the following transaction and identified a variance that requires your immediate attention:

Transaction Reference: BR-000052PRM
Policy Reference: 12401524
Insured: MCGill and Partners Ltd

Reconciliation Results:

Carrier's Expected Amount: €30,495.00
Amount Received from Broker: €30,425.00
Shortfall: €70.00

Variance Analysis:
Our Ora AI reconciliation system has identified a discrepancy in the gross premium amounts between carrier and broker records. Both parties correctly applied a 5% brokerage rate, but calculated from different base premiums, resulting in a €70.00 underpayment.

Detailed Breakdown:

- Carrier Gross Premium: €32,000.00
- Carrier Brokerage (5%): €1,600.00
- Carrier Expected Net: €30,495.00
- Broker Gross Premium: €32,026.32
- Broker Brokerage (5%): €1,601.32
- Broker Net Paid: €30,425.00
- Gross Premium Difference: €73.68
- Net Premium Variance: €70.00

Required Action:
We kindly request that you remit the additional €70.00 to reconcile this transaction. This adjustment will bring the net premium to the carrier's expected amount of €30,495.00.

Please confirm receipt of this request and advise on the expected timeline for the adjustment payment. If you require any clarification or have questions about this variance, please do not hesitate to contact us.

Best regards,
Finance Operations Team
Mosaic Syndicate Services Limited

Send Email

Status update – Awaiting adjustments by the broker

- After the email is sent, the main transaction card for BR-000052PRM updates to an **External Query** state, with the variance still shown as –€70.00.
- Ora AI Processing moves to **Query Management** at around 91%, and the card displays a message such as “Awaiting adjustments by the broker,” indicating that the next move depends on broker action.
- The card also notes that the transaction has been **Referred to Broker**, keeping the assignee (Mike Ross) visible so there is clear ownership while the system waits for a response.

Final outcome – Written-off and completed

- Once a decision is reached (for example, the carrier decides to write off the unrecovered variance), the status for BR-000052PRM is updated to **Written-Off** with Ora AI Processing at 100% and “Transaction completed.”
- At this stage, the card still shows the transaction amount of €30,421.10 but reflects the final variance state (for example, variance displayed as +€70.00 in the written-off view) to indicate how the difference was treated.
- From the operator’s perspective, the manual step—alerting the broker and sending the adjustment email—is complete, and Ora AI has finalized the financial outcome and ledger impact.

Transaction Detail view – 5-Stage Workflow

- When the operator opens **Transaction Detail: BR-000052PRM**, they see the 5-stage workflow header: Receive Statement → Reconciliation → Query Management → Referral → Completed, along with the status badges “[written off]” and “[Complex – Priority: Critical]” and the amount €30,421.10.
- Step 1, **Statement Received**, records that the broker remittance statement was received and ingested, including the declared amount (€30,491.10), policy (12401EU24), remittance

reference, source file name, and an Incoming status.

- Step 2, **Auto-Reconciliation**, shows that Ora AI matched the bank transaction (amount received €30,421.10) against the expected amount (€30,491.10), giving an 88–91% match confidence and marking the stage as “Auto-Reconciliation in progress” when the variance was first detected.
- Step 3, **Blocker: Gross Premium Variance**, notes that a variance was detected and flagged for review, explicitly calling out the variance amount and the fact that it exceeded the acceptable threshold.
- Step 4, **Query Management**, records that the transaction was moved into an external query, with the broker contact step and “Awaiting adjustments by the broker” reflected in the query status.
- Step 5, **Completed**, states that the transaction has been reconciled and posted to the ledger with a final status of Written-Off, including the ledger entry ID, confirmation that reconciliation is 100% complete, and a note that the variance has been handled according to policy.

Blocker – Data Entry Error (Complex – Underwriter Correction Required)(BR-000061PRM)

Scenario overview

A premium collection transaction (for example, BR-000061PRM) is in processing when Ora AI detects a **Data Entry Error** in the carrier's tax calculation data.

The broker has remitted the correct net amount based on accurate tax rates, but the carrier system is using incorrect tax percentages, creating a variance that cannot be auto-resolved. Because the root cause sits in the carrier system, the Finance Operator must escalate the issue to the underwriter for correction before reconciliation can complete.

Seeing the Data Entry Error on the transaction card

When the operator views the transaction card, they see a “Blocker Detected” chip and a red pill labelled “Data Entry Error.”

Ora AI Processing is in the Reconciliation stage (for example, around 87%), showing that the system has already matched the payment but stopped due to the detected error.

Key transaction context is visible on the card—amount, premium collection date and time, payer and policy number, and the assignee—so the operator knows exactly which policy and relationship are impacted.

Opening the Blocker Resolution Workflow

Clicking the “Data Entry Error” pill opens the **Blocker Resolution Workflow** for this transaction. In the Transaction Information panel on the left, the operator can see the reference (such as BR-000061PRM), amount received, expected amount, match confidence (for example, 62%), and payer/payee details, along with “Active Blockers: Data Entry Error.”

This panel confirms that the payment itself has been received correctly, but reconciliation confidence is low because the system believes the carrier’s tax breakdown is wrong.

Reviewing correct vs incorrect tax calculations

In the main analysis panel, Ora AI compares the **Correct** tax calculation (based on broker remittance and Ora AI rules) against the **Incorrect** calculation in the carrier system.

The correct side shows the gross premium, each tax component with the right percentages (for example, 12% UK IPT and 3% German tax), the total tax deduction, and the correct net premium due.

The incorrect side highlights the carrier system's wrong tax percentages (for example, 10% and 2%), the resulting under-calculated tax total, and an incorrect net premium.

A “Tax Calculation Analysis” breakdown further explains the impact, quantifying how much tax is missing and the exact shortfall that appears as a variance in reconciliation.

rates.

CORRECT	INCORRECT
Broker & Ora AI	Carrier System
Gross Premium: €30,491.10	Gross Premium: €30,491.10
UK IPT (12%): €3,658.93	UK IPT (10%): €3,049.11 ✗ Should be 12%
German Tax (3%): €914.73	German Tax (2%): €609.82 ✗ Should be 3%
Total Tax: €4,573.67	Total Tax: €3,658.93 ✗ Incorrect

[View Detailed Calculation Breakdown](#)

Tax Calculation Analysis

Base Amount: €30,491.10 (Gross Premium)

✓ **Correct Tax Calculation (Broker):**

UK IPT: $€30,491.10 \times 12\% = €3,658.93$
German Tax: $€30,491.10 \times 3\% = €914.73$
Total Tax Deduction: $€3,658.93 + €914.73 = €4,573.67$
Net Amount: $€30,491.10 - €4,573.67 = €25,917.43$ ✓

✗ **Incorrect Entry (Carrier System):**

UK IPT: $€30,491.10 \times 10\% = €3,049.11$ (WRONG - should be 12%)
German Tax: $€30,491.10 \times 2\% = €609.82$ (WRONG - should be 3%)
Total Tax Deduction: $€3,049.11 + €609.82 = €3,658.93$ (WRONG)
Net Amount: $€30,491.10 - €3,658.93 = €26,832.17$ ✗

Impact:

Undercalculated Tax: $€4,573.67 - €3,658.93 = €914.74$
System Expects: €26,832.17
Broker Remitted (Correct): €25,917.43
Variance in System: €914.74 shortfall due to data entry error

Recommended Actions

[Send to Underwriter to Make Corrections](#)

Sending to underwriter to make corrections

Below the analysis, the Recommended Actions area presents a guided button such as **Send to Underwriter to Make Corrections**.

The operator clicks this button to open the “Request Data Entry Correction from Underwriter” email modal, which contains From/To/CC/BCC fields, a Subject line, and a large Email Body area.

By selecting **Generate with Ora AI**

the operator auto-populates the subject and email body with a clear explanation of the issue: correct versus incorrect tax rates, correct net premium, incorrect carrier net premium, and the exact recalculation steps required.

The email also includes a concise “Required Action” section instructing the underwriter to update the tax rates and recalculate the policy so reconciliation can proceed; the operator reviews and then clicks **Send Email** to dispatch the request.

Card status – Internal Query and awaiting adjustments

After the email is sent, the transaction card state updates from “Blocker Detected” to **Internal Query**, indicating that the issue now sits with an internal stakeholder rather than the broker. Ora AI Processing moves into the Query Management stage (for example, around 87%), and a yellow banner appears on the card with text such as “Awaiting adjustments by underwriter.”

The assignee chip shows that the item has been referred to the underwriter, but Mike Ross remains visibly associated so operations has clear ownership while waiting for confirmation that the carrier system has been corrected.

Blocker – Unable to Identify the Transaction (Broker Data Correction, then Written-Off) (BR-000068PRM)

Scenario overview

- A premium collection transaction (for example, BR-000068PRM) is received for €30,491.10, but Ora AI cannot match the remittance to any active policy or expected payment.
- The transaction card shows **Blocker Detected** with a warning chip labelled **Unable to Identify the Transaction**, and reconciliation progress remains low.
- To resolve this Complex blocker, the Finance Operator must contact the broker, request corrected documents, and then allow Ora AI to complete reconciliation once updated data arrives.

Seeing the “Unable to Identify the Transaction” blocker on the card

- On the Finance Operations Dashboard, the card for BR-000068PRM displays the amount (€30,491.10), the negative variance versus the expected amount, and a status line indicating that the broker remittance file is being processed.
- A prominent pill **Unable to Identify the Transaction** appears beneath the payer and policy fields, clearly signalling that the system cannot locate a matching policy or expected payment in the carrier system.
- The card also shows the broker-supplied policy reference (for example, 14109EU24), payer (McGill and Partners Ltd), and the assignee (Mike Ross), giving the operator enough context before opening the blocker.

Opening the Blocker Resolution Workflow

- When the operator clicks the **Unable to Identify the Transaction** chip, the **Blocker Resolution Workflow** opens for BR-000068PRM.
- At the top of the panel, Valuation Information summarizes Amount, Expected, and Variance (for example, Amount €30,491.10, Expected €34,820.00, Variance -€4,328.90).
- A description explains that Ora AI cannot match the remittance details with any existing policy or expected payment and prompts the operator to contact the broker.
- A comparison table shows key remittance fields on the broker side (policy number, gross premium, insured name, inception date, settlement currency) and empty or missing values on the carrier side, highlighting that the carrier has no corresponding record.

Choosing “Alert Broker” in the blocker window

- In the Recommended Actions section, the operator sees options such as **Alert Broker** and **Refer to Finance Manager**, along with an Ora AI recommendation to request corrected documents.
- For this flow, the operator clicks **Alert Broker**, indicating that the next step is to obtain better data from the broker to identify the transaction.
- This action launches the email request process and records in the workflow that the broker channel has been chosen to resolve the blocker.

Dear McGill and Partners Remittance Team,

We have received your payment of €30,491.10 for transaction reference BR-000068PRM. However, we are unable to identify the transaction with the information provided.

Issue Details:

- Transaction Reference: BR-000068PRM
- Amount Received: €30,491.10
- Broker Comment: "Premium payment for policy 14109EU24 (does not align)"

Our Ora AI system has analyzed the remittance data but cannot match this transaction to any active policy or expected payment in our carrier system. The provided information does not align with our records.

Required Action:

Please review and provide the correct transaction details including:

- Verified policy reference number
- Complete remittance advice with accurate policy information
- Any supporting documentation to help us identify this transaction

The payment has been parked in suspense pending receipt of correct identification data. Your prompt attention to this matter will help us expedite the allocation process.

Best regards,
Mike Ross

Final completion – Non-Complex, Written-Off, and reconciled

- After some time, the broker provides the required corrected documents and remittance details, allowing Ora AI to identify the transaction and re-run reconciliation with accurate data.
- With the updated information, the transaction is reclassified as **Non-Complex**, meaning Ora AI can now handle it through straight-through processing with minimal or no additional manual intervention.

- The 5-Stage Workflow progresses through Statement Received, Auto-Reconciliation, any applicable internal variance handling, and finally **Completed**, where the transaction is reconciled, posted, and marked as **Written-Off** according to finance policy.

- At this point, the BR-000068PRM card shows Non-Complex status, 100% completion, and “Transaction completed,” while the underlying audit trail records each step—blocker detection, broker contact, awaiting data corrections, reclassification, and final written-off completion—for full transparency.

Blocker – Broker Tax Calculation Error (External Broker Adjustment, then Written-Off) (BR-000075PRM)

Scenario overview

A premium collection transaction (BR-000075PRM) is received for €28,450.25, but Ora AI detects that the broker has applied an incorrect Insurance Premium Tax (IPT) rate.

The transaction card shows **Blocker Detected** with a red pill labelled **Broker Tax Calculation Error**, and Ora AI Processing is in the Reconciliation stage at around 93%.

To resolve this Complex blocker, the Finance Operator must alert the broker, share the correct tax calculation, and wait for the broker to adjust their filing before the transaction is finally completed and written-off.

Seeing the “Broker Tax Calculation Error” blocker on the card

On the Finance Operations Dashboard, the BR-000075PRM card displays the payment amount (€28,450.25) with a positive variance (for example, +€632.23), indicating that something in the tax calculation does not align with expectations.

A yellow chip **Blocker Detected** appears at the top, and a red alert pill **Broker Tax Calculation Error** is shown below the policy and payer, highlighting that the discrepancy is related to IPT rates applied by the broker.

The card also shows that Ora AI Processing is in Reconciliation at about 93%, with ledger records already identified, so the operator knows that matching is done but the tax logic is blocked.

Opening the Blocker Resolution Workflow

When the operator clicks the **Broker Tax Calculation Error** pill, the **Blocker Resolution Workflow** opens for BR-000075PRM.

The Transaction Information panel summarizes reference (BR-000075PRM), amount (€28,450.25), expected amount (€27,818.02), variance (+€632.23), confidence score (around 65%), and the parties (Aon UK Limited to Mosaic Syndicate Services Limited), along with “Active Blockers: Broker Tax Calculation Error.”

This immediately tells the operator that the broker overpaid due to an incorrect tax rate, and that broker action will be required to correct their tax filing.

For this flow, the operator clicks **Alert Broker**, following the Ora AI recommendation to send a detailed IPT calculation breakdown to the broker.

This action opens a broker email pop-up, moving the workflow into an external-adjustment path.

Detailed Tax Breakdown

Broker's Incorrect IPT Calculation

Component	Amount (€)
Gross Premium	31,611.39
IPT (10% - Incorrect rate) ❌	-3,161.14
Amount Paid by Broker	28,450.25

❌ Error: Broker applied 10% IPT rate instead of the required 12% for this policy jurisdiction, resulting in underpayment

Correct IPT Calculation (12%)

Component	Amount (€)
Gross Premium	31,611.39
IPT (12% - Correct rate) ✓	-3,793.37
Expected Net Payable	27,818.02

✓ Correct: 12% IPT rate applies to this UK policy jurisdiction as per regulatory requirements

Root Cause

Broker (Aon UK Limited) applied incorrect Insurance Premium Tax (IPT) rate of 10% instead of the required 12% for this UK policy jurisdiction. This resulted in a payment shortfall of €632.23. The correct calculation should deduct €3,793.37 (12% IPT) instead of €3,161.14 (10% IPT).

Recommended Actions

Alert Broker

Refer to Finance Manager

Ora AI Recommendation

Send broker notification email with detailed IPT calculation breakdown. Broker (Aon UK Limited) must remit additional €632.23 in IPT to tax authorities. Transaction can be reconciled at €28,450.25, but broker must correct IPT filing. Include correct 12% IPT rate requirement for UK policies.

Other Actions

Manual Reconciliation

Generating and sending the broker email with Ora AI

The operator clicks **Generate with Ora AI**, and the system auto-creates a subject such as “Urgent: Tax Calculation Discrepancy – Transaction BR-000075PRM.”

The Email Body includes all key details: transaction reference, policy reference (15203EU24),

amount received, and a clear explanation that the broker applied 10% IPT instead of the required 12%, resulting in an over payment or shortfall of €632.23.

The message also outlines the **Required Action**: review the tax calculation, correct IPT filings, and issue adjusted remittance documentation reflecting the correct 12% IPT rate.

After reviewing the generated email, the operator clicks **Send Email**, submitting the alert and closing the pop-up while the system records this action in the audit trail.

Card status – External Query and awaiting broker adjustments

Once the email is sent, the BR-000075PRM card updates from **Blocker Detected** to **External Query**.

Ora AI Processing moves to the Query Management stage (for example, around 93%), and a yellow banner appears on the card stating **Awaiting adjustments by broker**.

A blue chip such as **Referred to Broker** is shown next to the assignee name, making it clear that the transaction is on hold pending broker tax corrections.

Awaiting adjustments by broker

Assigned to: Mike Ross **Referred to Broker**

Completion – Written-off and reconciled

After the broker updates their tax calculation and confirms the adjustment, Ora AI re-evaluates the transaction and finalizes reconciliation using the corrected figures.

The 5-Stage Workflow then shows: Statement Received – broker remittance statement received and ingested with declared amount and policy details; Auto-Reconciliation – payment matched with the bank transaction and variance detected; Blocker – Broker Tax Calculation Error – variance flagged and tax breakdown displayed; Query Management – external query created, broker alert email sent, and adjustments awaited; Completed – transaction reconciled and posted to the ledger with final status **Written-Off**, ledger entry ID, 100% reconciliation, and total variance treatment recorded (for example, €20.00 written off as bank charges if a small residual remains).

At this point, the BR-000075PRM card shows **Written-Off**, 100% completion, and “Transaction completed,” while the Complete Audit Trail lists events such as transaction received, assigned to operator, Ora AI analysis completed (including the IPT mismatch and overpayment note), moved to Reconciliation, blocker identified, broker alert sent, and final completion—ensuring end-to-end transparency for finance and audit teams.

Blocker – Wrong Policy Reference Sent by Broker (Internal Adjustment, then Completed) (BR-000082PRM)

Scenario overview

A premium collection transaction (BR-000082PRM) is received for €22,350.75, but Ora AI detects that the policy reference on the broker remittance does not exist in the carrier system. The transaction card shows **Blocker Detected** with a red pill labelled **Wrong policy reference sent by broker**, while Ora AI Processing is in the Reconciliation stage at a low completion percentage.

Seeing the “Wrong policy reference sent by broker” blocker on the card

On the Finance Operations Dashboard, the BR-000082PRM card displays the payment amount (€22,350.75) along with its processing timestamp and the broker name (Willis Towers Watson). A yellow **Blocker Detected** chip appears at the top of the card, and a red alert strip labelled **Wrong policy reference sent by broker** is shown beneath the policy number 16408EU24 provided by the broker.

The Ora AI Processing bar indicates that the transaction is in Reconciliation, with a small percentage complete, and the status text notes that the broker remittance file is being received.

To live job who is wrong janhvi Kapoor Opening the Blocker Resolution Workflow

When the operator clicks the **Wrong policy reference sent by broker** alert, the **Blocker Resolution Workflow** opens for BR-000082PRM.

The Transaction Information panel shows the reference, amount (€22,350.75), expected amount (€22,350.75), a confidence score around 45%, and payer/payee details, confirming that amount and dates look correct but the policy ID is suspicious.

An Active Blockers section explains that the policy reference 16408EU24 does not exist in the carrier system, and that based on payment amount and inception date, the expected policy reference is likely 16407EU24.

Reviewing Ora AI document mismatch analysis

In the main analysis panel, the **Ora AI Document Mismatch Analysis** compares Broker Remittance fields to Carrier Records.

For Policy Reference, the Broker Remittance column shows 16408EU24, while the Carrier Records column shows 16407EU24 (Expected), and the Status column marks this row as a red **Mismatch**.

Premium Amount and Inception Date both show matching values, each with a green **Match** status, indicating that the only inconsistency is the policy reference itself.

This layout makes it clear that the broker likely typed the wrong policy ID while the rest of the remittance details are correct.

Choosing “Adjustments on Broker Remittance”

Under **Recommended Actions**, the operator sees a primary button **Adjustments on Broker Remittance**, along with a secondary “Refer to Finance Manager” option and an Ora AI recommendation to send corrected details to the broker if needed.

For this flow, the operator clicks **Adjustments on Broker Remittance** to reconcile the policy

reference inside the system rather than escalating externally.

This opens an adjustment modal focused on resolving the policy reference discrepancy.

Adjusting the broker remittance – choosing an adjustment method

In the **Adjustments on Broker Remittance** modal, Ora AI reiterates its recommendation: the broker provided 16408EU24 but the carrier system shows 16407EU24, and the operator can either override with carrier data or enter the correct reference manually.

The **Current Information** section displays both values side by side, with Broker Policy Reference 16408EU24 and Carrier Policy Reference 16407EU24.

In the **Select Adjustment Method** area, two options are available:

- **Override with Carrier Data** – use the carrier system’s policy reference 16407EU24.

Confirm Adjustment

If the operator selects **Enter Manually**, a Policy Reference field becomes active so they can type the desired policy number and add any remarks explaining the decision, before confirming the adjustment.

If they choose **Override with Carrier Data**, the carrier reference 16407EU24 is preselected, simplifying the process when Ora AI's suggestion is accepted.

Confirming the adjustment

After selecting the appropriate method, the operator clicks **Confirm Adjustment** at the bottom of the modal.

Once confirmed, the policy reference mismatch blocker is resolved: the transaction now uses the corrected policy ID (for example, 16407EU24) in all subsequent reconciliation steps.

The Blocker Resolution Workflow is updated to reflect that the adjustment has been applied, and the active blocker is cleared from the list.

Transaction progression and completion

With the policy reference corrected, Ora AI continues processing BR-000082PRM through the rest of the 5-Stage Workflow.

The workflow shows Statement Received (remittance statement ingested), Auto-Reconciliation (amount matched to the bank transaction), and the previously blocked policy reference step, which now passes because the ID aligns with carrier records.

Query Management, if used in this case, is internal and auto-resolved since no external clarification is needed once the operator has confirmed the correct policy reference.

Finally, the transaction reaches the Completed stage: the card shows **Completed**, the Ora AI Processing bar is at 100%, and the status line says “Transaction completed,” with the updated policy reference 16407EU24 and the full audit trail recording receipt, reconciliation, blocker identification, adjustment confirmation, and final posting to the ledger.

Stage 1: Receive Statement

The intake phase where the system aggregates raw data.

- Broker Remittance (5–8 sec):** Ora AI ingests the remittance file/feed, parsing Policy ID, Period, Currency, and Reference numbers.
- Bank Statement (5–8 sec):** The system fetches bank transaction data via API or upload and identifies relevant cash entries.
- Ledger Identification (10–14 sec):** The system looks up expected records (Premium, Commission, Tax) in the internal ledger to prepare for matching.

Step 1: Statement Received

Broker remittance statement received and ingested

Source: image2.png. Remittance Reference: BR-000045PRM. Amount Declared: €30,491.10. Policy: 110721E124. Status: Incoming

Stage 2: Auto-Reconciliation

The core processing phase where logic is applied.

- Three-Way Matching:** The AI compares Broker Remittance vs. Bank Statement vs. Ledger Expectation.

- 2. **Component Allocation:** Payments are split into Net Premium, Commission, Taxes, and Fees.
- 3. **Blocker Detection:** The system scans for variances in Amount, FX Rates, or Timing.
 - *Result:* If matched, the transaction moves to **Completed**. If a mismatch is found, it moves to **Query Management**.

Step 2: Auto-Reconciliation

Ora AI matched with bank transaction and detected variance

Bank: Lloyd's Bank - Transaction ID: N/A. Amount Received: €30471.10. Expected Amount: €30491.10. Match Confidence: 100%. Status: Auto-Reconciliation complete

Stage 3: Auto Resolution (Blocker Handling)

If a blocker is detected (e.g., "Potential Duplicate Transaction"), the system attempts to categorize the root cause.

- **Chip System:** Blockers appear as clickable "Chips" on the transaction card.
- **Resolution:** Clicking the chip opens the **Resolution Workflow**, where the operator can accept AI recommendations (e.g., "Reject Duplicate") or perform manual overrides.

Step 3: Blocker: Gross Premium Variance

Variance detected - flagged for review

Gross Premium Variance: €20.00. Variance Threshold: €30.00. Status: Within acceptable threshold. Blocker Severity: Low (Green). Auto-resolution: Eligible

Stage 4: Query Management (Variable Duration)

Used for **Complex Transactions** where external input is needed.

- **AI-Generated Emails:** If a variance is confirmed (e.g., a €70.00 discrepancy), Ora AI automatically drafts an email to the Broker or Underwriter.
- **Context Aware:** The email draft includes all relevant transaction references and variance details automatically.
- **Action:** The operator reviews the draft and clicks **"Send Mail"**. The transaction remains in t Hello his stage until a response triggers a re-reconciliation loop.

Dear Broker,

We have completed the reconciliation for the following transaction and identified a variance that requires your immediate attention:

Transaction Reference ID: 0000029004

Policy Reference: 00000004

Insured: M&D and Partners Ltd

Reconciliation Results

Carrier's Expected Amount: €304,490.00

Amount Received from Broker: €304,420.00

Shortfall: €70.00

Variance Analysis

Our OTC AI reconciliation system has identified a discrepancy in the gross premium amounts between carrier and broker records. Both parties correctly applied a 1% brokerage rate, but calculated from different base premiums, resulting in a €70.00 underpayment.

Detailed Breakdown

Carrier Gross Premium: €300,000.00

Carrier Brokerage (1%): €3,000.00

Carrier Expected Total: €303,000.00

Broker Gross Premium: €300,000.00

Broker Brokerage (1%): €3,000.00

Broker Net Total: €303,000.00

Gross Premium Difference: €70.00

Net Premium Variance: €70.00

Required Action

We kindly request that you remit the additional €70.00 to reconcile this transaction. This adjustment will bring the net premium to the carrier's expected amount of €303,000.00.

Please confirm receipt of this request and advise on the expected timeline for the adjustment payment. If you require any clarification or have questions about this variance, please do not hesitate to contact us.

Best regards,

Finance Operations Team

5. Transaction Details panel under the workflow

- Directly beneath the 5-Stage Workflow, the Transaction Details panel provides a static snapshot of all key attributes for the transaction.
- On the left side, the Finance Operator can see payer and payee information, including organization names, internal IDs, and the policy number associated with the transaction.
- The panel also shows the transaction date and any additional reference data that might be needed for reconciliation or downstream reporting.
- On the right side, the channel (for example, ACH or Bank Transfer), the bank reference, and the broker statement source file name are displayed so operators can trace exactly how and where the payment came in.
- An Ora AI Match Confidence indicator is shown with a percentage and a status chip (for example, “Blocker” when confidence is 0%), giving a quick visual cue on how well the system believes the payment matches expected records.

Quick recap

- The Finance Operations Dashboard centralizes transaction monitoring, from intake to completion, with real-time counts and a visual funnel across key stages.
- Ora AI automates statement ingestion, three-way matching, component allocation, and common variance resolutions, escalating only Complex items that require human judgment.
- Transactions are classified into Non-Complex (high-confidence, straight-through) and Complex (lower-confidence, discrepancy-driven) groups so Mike can prioritize work.
- A five-stage lifecycle—Receive Statement, Auto-Reconciliation, Auto-Resolution, Query Management, and Completed—provides a consistent processing model for every transaction.
- A detailed audit trail records events, actors, timestamps, and status changes, giving full transparency across the entire transaction journey.
